Справочник по автоматическим измерительным приборам и устройствам
автоматической обработки материалов. М.: Издательство "Машиностроение", 1971.
128 с., иллюст., 16x19. Цена 35 р. Книга сильно изношена. 1/2, 300 copies printed.

TOPIC TAGS: automatic control, automatic temperature control, automatic pressure control, automatic vacuum control, temperature instrument, pressure measuring instrument, flow meter, liquid level instrument, pneumatic servomechanism

OPINION AND OVERVIEW: The book describes the equipment used for automatic control, regulation, and automation of technological processes, and discusses temperature, pressure, and liquid level devices, hydraulic, pneumatic, electric, and electronic control-action mechanisms. The book is intended for engineers, and technical personnel engaged in design, planning, and construction of automated industrial enterprises, and may be useful to students at higher and secondary specialized schools.

BEKAJLO, Romuald and PROST, Edmund, Chair for the Hygiene of Animal Products (Katedra Higieny Produktow Zwierzeczych), Veterinary Division (Wydzial Weterynaryjny), WSR [Wysza Szkoła Rolnicza, Higher School of Agriculture] in Lublin (Director: Docent, Dr. Edmund PROST)

"Colibacteriosis of Slaughter Chickens."

Warsaw-Lublin, Medycyna Weterynaryjna, Vol 19, No 3, Mar 63, pp 143-145.

Abstract: [Authors' English summary modified] A sanitary veterinary study covering 30,230 chickens revealed 211 or 0.7 percent cases with pericarditis serofibrinosa. The pathogenic agent was disclosed to be E coli of serotypes 071, 08, and 03. Bacteriological examination of the muscle tissue of the affected animals revealed a strong bacteremia with E. coli, and the authors recommend that such chicken should be marked as conditionally fit for consumption. There are 9 references, of which 2 are Polish, 3 German, and 4 English.

"Incidence of Tuberculosis in Slaughter Geese."

Warsaw-Lublin, Medyarna Weterynarna, Vol 19, No 5, May
63, pp 254-255.

Abstract: Routine inspection of slaughtered geese revealed an appreciable number which, despite well developed meat (muscles) and fat, indicated the liver, spleen, and heart affected by tuberculosis; no changes were noted in the other organs, joints, or bone marrow. Histological examination confirmed presence of affected foci, but bacteriologically, mainly biological tests were positive, proving the TB to be of avian type. Though regulations are specific on inadmissibility of such meat for export, they are not clear with respect to domestic consumption, and should be declared only conditionally usable. There are no references.

Fractional method of aggregate analysis of soil. N. E. Bekarevich,
A. B. Kruchina, and V. M. Sotnikova (Vsesoyuznyi, 1953, No. 3,
44-54; *Soils & Fert.*, 1953, 18, 355).—Air-dry soil is fractionated
by dry-sieving and the aggregate stability by wet-sieving after
rapid moistening. The stability of the fraction 0.25—0.5 mm. and
the effect of fractional size on aggregate stability are better indica-
tions of the agronomic characteristics of the soil than is the aggregate
stability determined after capillary moistening or on unfractionated
soil.

Akad Nauk SSSR, 1956, 489-512.Abstract : This is an examination of the physical properties of the takyry of the Kopet-Dagh mountain plain and the lower reaches of the Amu-Dar'ya. The volumetric weight -- 1.4 -- of the upper part of the crust is much lower than that of the lower part of the crust which, to a depth of 1.65 cm., looks like a dwarf alluvial /illyuvial'nyy/ horizon. The total, including non-capillary, porosity of the upper part of the crust reaches 16%, and 6% in the lower part; the maximal hygroscopic moisture and the withering coefficient

are, correspondingly, 4.9% and 5.2%. When the takyry of the mountain plain are wet and the temperatures low, the speed of filtration is very slight -- 0.000003 cm./second, or 1 m³/hectare per hour. When the weather is warm the speed of absorption increases more than 1000%, reaching 14 m³/hectare per hour. The poor filtration qualities of the takyry derive from the properties of the crust and of the rocks from which the soil is formed -- the amount of clay which they contain, their stratification. Breaking up the surface horizons of the takyry to a depth of 25 cm. improves their filtration properties only for two hours. A longer-lasting effect can be attained by combining plantage plowing /plantazhnaya vspyshka - sic/ with application of organic fertilizers or sand; this method raises the speed of filtration to 50-80 m³/hectare per hour. The field moisture capacity of the

AUTHORS: Bekarevich, I. L., Khalatnikov, I. M.TITLE: Theory of the Kapitsa Thermal Discontinuity on the Interface
Between Liquid He³ and a SolidPERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,
Vol. 39, No. 6(12), pp. 1699 - 1712

TEXT: Heat transfer between liquid He II and the surrounding solid is accompanied by a temperature jump which is related to the complicated temperature exchange between He II and the phonons of the solid. A similar effect is displayed by He³ where the surface of the solid performs small vibrations, and the moved liquid carries away a small amount of energy. Nonetheless, a temperature jump occurs on the boundary. A theoretical description of this effect is presented here. The authors used liquid He³ which was in contact with the vibrating surface of a solid. At low temperatures, liquid He³ can be regarded as a Fermi fluid, and its condition is characterized by an excitation distribution function which

satisfies the equation of motion $\frac{\partial n}{\partial t} + \frac{\partial n}{\partial r} \frac{\partial \varepsilon}{\partial p} - \frac{\partial n}{\partial p} \frac{\partial \varepsilon}{\partial r} = I(n)$ (n - distribution function; ε - excitation energy which is a function of n ; $I(n)$ - collision integral; p - momentum). It may be assumed that all points of the body surface oscillate in phase. Therefore, the distribution function is only a function of the normal to the surface z . n is set equal to $n_0 + n_1$, where n_0 is the equilibrium Fermi function at absolute zero; thus, $\varepsilon = \varepsilon_0 + \int f(p, p') n_1(p') dp'$ and $f(p, p') = \delta\varepsilon(p)/\delta n(p')$. Spherical coordinates, θ and χ , are introduced (θ is the angle between p and z ; χ is the azimuthal angle), μ is substituted for $\cos \theta$, and the z -coordinates are measured in units of the mean free path ($l = v_0 \tau$); with $\omega \rightarrow \infty$ (ω - oscillation frequency) one obtains equation (8):

$\mu \frac{d\psi}{dz} + (1-i\omega\tau)\psi = -\frac{i\omega\tau F_0}{1+F_0}\psi_0 - \frac{3i\omega\tau F_1}{1+F_1}\mu\psi_{1n} - \frac{3i\omega\tau F_1}{1+F_1} \cdot \sqrt{1-\mu^2} \cos \chi \psi_{1t}$. Next, the suitable boundary conditions are determined. When substituting $\psi(\mu)$ for $\psi(z, \mu)$ at $z=0$, one obtains equation (15): $\psi = -p_0 u_z (\mu + \frac{f}{\omega}) - p_0 u_t \sqrt{1-\mu^2} \cos \chi$.

and the condition for f reads $\psi_{1n} = \frac{1}{2} \int_{-1}^{+1} \mu \psi(\mu) d\mu = -p_0 u_z / 3$. The solution to (8) is divided into two parts (proportional to u_x and u_t) according to the two terms of (15). The solution corresponding to perpendicular surface oscillations is called the longitudinal solution, while that corresponding to tangential surface oscillations is called the transverse solution. The two types of solutions are discussed, and several relations are derived for diffuse reflection in both cases. Thereupon, mirror reflection is studied, in which case a solution is obtained through a Fourier expansion. Finally, several formulas are presented for the thermal resistance of the boundary, which is proportional to T^{-3} . Academician L. D. Landau is thanked for discussions. V. A. Fok is mentioned. TITLE: Complex frequency characteristics of linear systems with periodically varying parameters

SOURCE: Radiotekhnika i elektronika, v. 8, no. 8, 1963, 1407-1417

TOPIC TAGS: frequency characteristic, parametric amplifier, parametric converter, mixer

ABSTRACT: A theoretical method is considered of approximate determination of frequency characteristics of periodically-time-varying linear systems. The method is based on a description of a two-pole network by an infinite matrix whose determinant is similar to that of the Hill matrix. Each parameter may vary according to its own law, but their periods are equal. Limited-order matrix are used in analyses of practical cases. For a high Q-factor of the

Card 1/2

L 17277-63

O
oscillatory system and small relative amplitude of varying parameters, 2nd and 3rd order matrices provide sufficient accuracy. With the 2nd order matrices, complex transfer coefficients of parametric two-circuit amplifiers, converters, and varying-resistance converters are found. The formulas obtained for complex transfer coefficients are similar to the equations of resonance characteristics of two-circuit coupled systems, which fact makes the formulas easy to see and convenient in application. PERIODICAL: Gornyy Zhurnal, 1958, Nr 6, pp 52-55 (USSR)

ABSTRACT: The above mentioned article was published in Nr 5 (1957) and Nr 2 (1958) of this periodical. In the discussion, representatives of different scientific organizations present their views on loading mechanization and describe different machines created for this purpose by their organizations. The editors relate the decisions of an All-Union scientific-technical conference which took place in Leningrad in January 1958. The conference recommended the construction of 5 basic types of loading machines, each adapted for work under specific conditions. The conference also recommended the design in 1958-59 of one standard type of loading machine.

ABSTRACT:	Several linear copolymers and polycondensates of B-methyl-N-triphenylborazole with diisocyanates and diamines were prepared and characterized. The object of this work was to synthesize thermally stable (above 400°C) polymeric materials. Copolymers with hexamethylenediisocyanate, p-toluinediisocyanate and 4,4'-diphenylenediisocyanate were synthesized according to the following scheme	15	
Card 1/3			

L 1127-66

ACCESSION NR: AP5022934

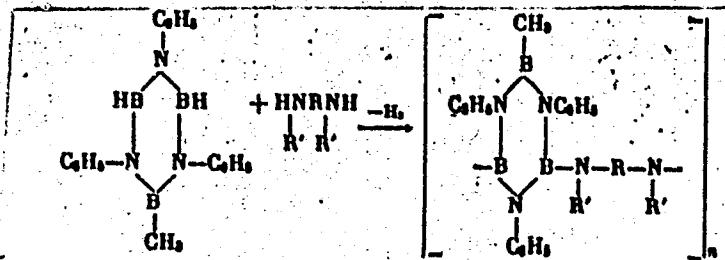

These are solids having 4,000-6,000 molecular weight. Their softening temperature is within the 100-110°C range and they begin to decompose above 100°C. Polycondensates of B-methyl-N-triphenylborazole with hexamethylenediamine, /p-phenylenediamine, and N,N'-diisopropylhexamethylenediamine were synthesized according to the following scheme

Card 2/3

L 1127-66

ACCESSION NR: AP5022934

where R=-(CH₂)₄-; -C₆H₄-; R'=H; i-C₃H₇

Polycondensate with hexamethylenediamine was a brittle transparent solid with a softening temperature of about 70°C. It was stable up to 260°C and its reduced viscosity in cresole was 0.19. Polycondensate with p-phenylenediamine was a brittle transparent solid with softening temperature at 120°C and reduced viscosity in cresole 0.11. It was stable up to 300°C. An attempt to prepare a polycondensate with N,N'-diisopropylhexamethylenediamine was unsuccessful. Orig. art. has: 1 figure.

ABSTRACT: The reaction of the polycondensation of ethylene gly= col with the esters of terephthalic acid takes place very slowly without catalysts. The number and the kind of catalysts exercise an essential influence on the velocity of the reaction as well as on the molecular weight of the forming terephthalates. According to patent data alcoholic metals, alcoholates (and their oxides) are suggested for the production of polyethylene terephthalates (of dimethylterephthalate and ethylene glycol). As initial substances dimethyl terephthalate and ethylene glycol as well as diethylol

terephthalate were used. The polycondensation process takes place in two stages: the peresterification and the polycondensation. The use of diethylol terephthalate for the production of polyester has hitherto not been described in technical literature. For the first time one of the authors of this work suggests the production of polyester. The results of the polycondensation of diethylol terephthalate is shown in table 2. The effect of some better usable catalysts was examined by some experiments. The results obtained showed that caustic alkali can be used successfully as catalyst. The duration of heating in vacuum must be prolonged in this case (see table 3). With germanium dioxide (or lithium-hydroxide addition respectively) satisfactory results were also achieved. However, they were not better than those obtained with aluminum oxide and lithium hydroxide. There are 3 tables and 10 references, 4 of which are Soviet.

ABSTRACT: The reaction of the polycondensation of diethylole-terephthalate has hitherto not been described in detail in technical literature. In the present paper the authors report on the results of kinetic investigations of the polycondensation reaction which takes place as follows: $n \text{ HOCH}_2\text{CH}_2\text{OCOC}_6\text{H}_4\text{COOCH}_2\text{CH}_2\text{OH} \longrightarrow \rightarrow \text{H(OCH}_2\text{CH}_2\text{OCOC}_6\text{H}_4\text{CO)}_n\text{OCH}_2\text{CH}_2\text{OH} + (n-1)\text{HOCH}_2\text{CH}_2\text{OH}$.

terephthalate in temperature intervals of from 240-285° at atmospheric pressure was investigated. Furthermore the velocity of the reaction was determined. The activation was determined (35000 cal/mol). It was found that the polyesterification of diethylole terephthalate without catalysts obeys the reaction rules of the second order. At a temperature of 285° the reaction equilibrium is set up and a further heating does not change the molecular weight of the polyester any longer. The kinetics of the polyesterification of diethylole terephthalate was investigated in the presence of catalysts consisting of an hydrate of lithium oxide and lithium aluminate. These catalysts accelerate the reaction. There are 3 figures, 3 tables and 18 references, 12 of which are Soviet.

TITLE: On the Heterogeneous Chain Polyesters (O geterotseplykh poliesterakh) Communication 11: Chemical Destruction of Polyethyleneterephthalate (Soobshcheniye 11. Khimicheskaya destruktziya poliethylenetereftalata)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Khimicheskikh Nauk, 1958, Nr 5, pp. 614 - 617 (USSR)

ABSTRACT: Polyethyleneterephthalate (and all products of it) is very stable in chemical respect. This property favors its processing. Polyethyleneterephthalate is difficult to dissolve and as polyester it must enter chemical reaction. The present report is devoted to the investigation of this property of polyethyleneterephthalate. The destruction of polyethyleneterephthalate was investigated in cresol-solution at various temperatures. It was found in this connection that polyester decomposes when heated above 110°C. Moreover the acidolysis and glycolysis of

of Polyethyleneterephthalate

Polyethyleneterephthalate in a diphenyl-solution (at 200°C) on the action of adipic-acid and ethylene-glycol was investigated. It was found with this investigation that the degree of decomposition increases if an increase of the decomposing substances is observed simultaneously. Concluding, the decomposition-products were more closely defined. There are 3 figures and 14 references, 8 of which are Soviet.

TEXT: In this letter to the editor, the authors report on the successful copolymerization of boron-substituted borazoles with hexamethylene diisocyanate. They obtained transparent, glassy, yellowish substances. The following reaction diagram is given:
